## Decrypting integrins by mixed-solvent molecular dynamics simulations

Ioana M. Ilie<sup>1,2\*</sup>, Claus Ehrhardt<sup>3</sup>, Amedeo Caflisch<sup>3</sup> and Gabriele Weitz-Schmidt<sup>4\*</sup>

<sup>\*</sup>corresponding authors: <u>i.m.ilie@uva.nl</u>; <u>gabriele.weitz@allocyte-pharma.com</u>

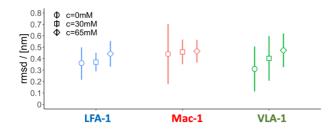

Figure S1 Average root mean-square-deviations (RMSD) of  $\alpha_7$  with respect to the rest of the I domain at 350K. The reference structure is the closed conformation. For LFA-1 the reference structure is a representative closed conformation post-equilibration. First structural alignment of the individual snapshots saved along the MD simulations is carried out on the Ca-atoms of all residues except those comprised in  $\alpha_7$  i.e. F292-I306, F302-I316 and E317-I331 for LFA-1, Mac-1 and

VLA-1, respectively. Then for each MD snapshot the  $a_7$  Ca-RMSD is calculated as  $\sqrt{\frac{1}{N}\sum_{i=1}^{N}(r_i-r_i^{ref})^2}$ , where  $r_i$  and  $r_i^{ref}$  are the actual and reference coordinates, respectively, of the  $\alpha_7$  Ca atom i and N the number of residues in  $\alpha_7$ . The error bars represent the standard error of the mean calculated as the standard deviation of the average values over the five independent runs.

#### Molecular dynamics simulation movies

The movies show the  $\alpha$  I domains of the three studied systems on a timescale of 1  $\mu$ s, with snapshots captured every 1 ns. The  $\alpha$  I domain is shown in cartoon representation using secondary structure coloring, *i.e.* purple for  $\alpha$  helices blue for  $3_{10}$  helices, yellow for  $\beta$ -sheets, white and cyan for loops and coils, respectively. The  $\alpha_7$  helix is highlighted. The *closed* conformation is shown in white cartoon representation. For LFA-1, the closed conformation was selected post-equilibration. For Mac-1 and VLA-1, the *closed* conformations correspond to the crystal structures. Benzene molecules are shown as grey spheres.

#### S1. LFA-1, 0 mM benzene

In aqueous solution, the  $\alpha$  I domain of LFA-1 shows small deviations from the *closed* conformation.

#### S2. Mac-1, 0 mM benzene

In aqueous solution, the  $\alpha$  I domain of Mac-1 shows small deviations from the *closed* conformation.

#### S3. VLA-1, 0 mM benzene

In aqueous solution, the  $\alpha$  I domain of VLA-1 shows small deviations from the *closed* conformation.

#### S4. LFA-1, 30 mM benzene

The addition of benzene molecules stimulates the opening of the  $\beta_6$ - $\alpha_7$  pocket. At first, single benzene molecules interact with the  $\beta_6$ - $\alpha_7$  pocket without disturbing its *closed* conformation. The helix moves then away from  $\beta_6$  as more benzene molecules intercalate between  $\beta_6$  and  $\alpha_7$ .  $\alpha_7$  moves back towards  $\beta_6$ , thereby closing the pocket as the benzene molecules leave the pocket. Occasionally, benzenes intercalate between  $\alpha_7$  and  $\alpha_1$  pushing the two helices away from each other.

#### S5. Mac-1, 30 mM benzene

Benzene molecules interact with residues in the  $\beta_6$ - $\alpha_7$ - $\alpha_1$  pocket, thereby inducing the opening of the new pocket. Seldom benzene interaction with the  $\beta_6$ - $\alpha_7$  pocket does not suffice to generate the opening of the allosteric pocket.

#### S6. VLA-1, 30 mM benzene

Benzene molecules intercalate in the  $\beta_6$ - $\alpha_7$  pocket and occasionally between  $\alpha_7$  and  $\alpha_1$ , inducing sporadic shifts of  $\alpha_7$  from the *closed* structure.

## S7. LFA-1, 65 mM benzene

Multiple benzene molecules are inserted into the  $\beta_6$ - $\alpha_7$  pocket, which prompt the wide opening of the allosteric site. Additionally, the new  $\beta_6$ - $\alpha_7$ - $\alpha_1$  pocket forms due to the insertion of benzene molecules.

### S8. Mac-1, 65 mM benzene

Benzene molecules prompt the opening of both pockets through the shifting of the  $\alpha_7$  helix.

#### S9. VLA-1, 65 mM benzene

Benzenes intercalate between helices  $\alpha_7$  and  $\alpha_1$ , prompting the shift of the  $\alpha_7$  helix.
